Provider Specifications for WIR Access

Providers need only a PC with Internet connectivity for access. If your organization has an existing electronic database, you have options to link with WIR. These options are as follows:

1. Data conversion of existing database via a flat file specification to WIR. Even billing data can be converted and loaded into WIR. Then clinicians would use WIR to track clients and immunizations.
2. Continue to use your existing system and link with WIR via an ASCII text file or a HL7 compliant interface to download immunization data to WIR.
3. Have clinicians use WIR for data entry and then have WIR send data back to the organization for billing purposes via an ASCII text file or a HL7 compliant interface.
4. Use HL7 to do real-time queries to WIR from Electronic Medical Record (EMR) System.
